

RWorksheet_Octaviano#3b

2023-10-10

*#1. Create a data frame using the table below.
#a. Write the codes.*

```
resp_no <- c(1:20)
sex <- c(2,2,1,2,2,2,2,2,2,1,2,2,2,2,2,2,1,2)
occ <- c(1,3,3,3,1,2,3,1,1,1,3,2,1,3,3,1,3,1,2,1)
pers_at_home <- c(5,7,3,8,5,9,6,7,8,4,7,5,4,7,8,8,3,11,7,6)
sibs <- c(6,4,4,1,2,1,5,3,1,2,3,2,5,5,2,1,2,5,3,2)
h_type <- c(1,2,3,1,1,3,3,1,2,3,2,3,2,2,3,3,3,3,3,2)

household_data <- data.frame(
  Respondents = resp_no,
  Sex = sex,
  FatherOccupation = occ,
  PersonAtHome = pers_at_home,
  SiblingsAtSchool = sibs,
  HouseType = h_type
)
household_data
```

##	Respondents	Sex	FatherOccupation	PersonAtHome	SiblingsAtSchool	HouseType
## 1	1	2	1	5	6	1
## 2	2	2	3	7	4	2
## 3	3	1	3	3	4	3
## 4	4	2	3	8	1	1
## 5	5	2	1	5	2	1
## 6	6	2	2	9	1	3
## 7	7	2	3	6	5	3
## 8	8	2	1	7	3	1
## 9	9	2	1	8	1	2
## 10	10	2	1	4	2	3
## 11	11	1	3	7	3	2

```

```
# the data frame consists of 20 observations(rows) and 6 variables (columns)
```

```
# the variables are:
```

```
# respondents - which contains a numeric identifier for each respondent
```

```
# sex - represents the gender of the respondent (1 for male, 2 for female)
```

```
# father's occupation - indicates the father's occupation (1 for farmer, 2 for driver, 3 for others)
```

```
# persons at home - represents the number of people at home
```

```
# siblings at school - indicates the number of siblings attending school
```

```
# type of house - describes the type of house (1 for wood, 2 for semi-concrete, 3 for concrete)
```

```
#c. Is the mean number of siblings attending is 5?
```

```
sibs_mean <- mean(household_data$SiblingsAtSchool)
```

```
sibs_mean
```

```
## [1] 2.95
```

```
# the mean of the number of siblings at school is 2.95, which is not 5
```

```
#d. Extract the 1st two rows and then all the columns using the subsetting functions. Write the codes and its result.
```

```
firstTwoRows <- household_data[1:2,]
```

```
firstTwoRows

# there are five observations

# -----

#2. Write a R program to create an empty data frame. Using the following codes:
df = data.frame(Ids=integer(),
                Doubles=double(), Characters=character(),
                Logicals=logical(),
                Factors=factor(),
                stringsAsFactors=FALSE
)

print("Structure of the empty dataframe:")

## [1] "Structure of the empty dataframe:"

print(str(df))

## 'data.frame':    0 obs. of  5 variables:
## $ Ids      : int
## $ Doubles   : num
## $ Characters: chr
## $ Logicals  : logi
## $ Factors   : Factor w/ 0 levels:
## NULL
```

```

# df is an empty data frame created with 0 rows and 5 columns
# the columns has the following data type:
# ints = integer
# doubles = double
# characters = character
# logicals = logical
# factors = factor (0 levels which means empty)

# serves as a template and can be populated with data

# -----

#3.Create a .csv file of this. Save it as HouseholdData.csv

new_resp <- c(1:10)
new_sex <- c("Male", "Female", "Female", "Male", "Male", "Female", "Female", "Male", "Female", "Male")

## 9 9 9 2 Farmer 11 6 3
```

#4. Interpret the graph.

On July 14, there were more negative sentiments compared to the other sentiments. This could indicate a negative sentiment trend.
On July 15, all sentiments increased, with the negative sentiment as the highest. This could imply that the negative sentiment was the most prevalent.
On July 17 and July 18, the negative sentiments stayed high and the neutral and positive sentiments remained low.
On July 20, all sentiments got to their lowest with but there were still more negative sentiments than the other two.
On July 21, experienced an increase in all sentiments, with the negative being the highest. This could indicate a positive sentiment trend.

From this data, we could assume that public sentiment is responsive to external factors and it also v
